#### Overview

This document showcases how to create and use RMarkdown documents.

## You can easily create headings. This is a first order heading.

#### Then move down in heading order size

#### Like this subheading

#### And this fourth order heading

You can write in **bold** and *italicised* text (in **two** different ways).

You can write in-line code if you want to differentiate between when you are typing normally or highlighting model parameters, for example.

Equations like this  $t' = \gamma(t - vx/c^2)$ , to appear within text lines.

Create links to your website.

Make footnotes $^{1}$ .

Insert line breaks between text like this, which works best in large slabs of text Insert a horizontal line break using five asterisks ('\*\*\*\*\*')

The raw Rmd file also has the code for inserting user comments.

(There is also a page break here. Best seen in PDF. Check the raw Rmd file to see the code)  $\,$ 

 $<sup>^1\</sup>mathrm{Here}$  is the footnote you created earlier, automatically formatted

## Define equations

Accordingly, we write the eigenfunction of a spinless particle as the superposition of plane wave states of momentum  $(\pi)$  and energy  $(E_j)$  having amplitudes  $a(\pi, E_j)$  (from [1]).

$$\phi n(r,t) = \sum_{i,j} a(p_i, E_j) e^{\frac{i}{\hbar}(p_i \cdot r - E_j t)}$$

## Create, alter, and embed plots

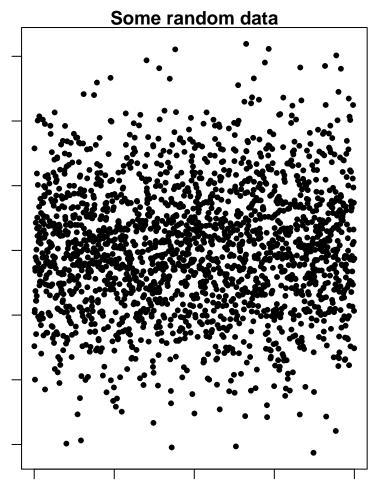

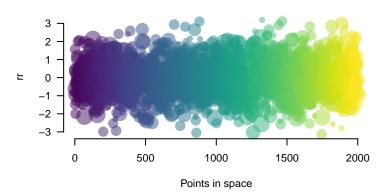

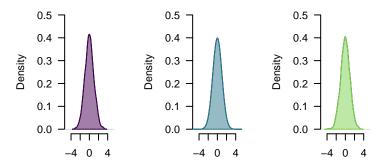

Figure 1. Example of a stock plot embedded into a PDF from RMarkdown.

#### Show plots with associated code

```
suppressWarnings(require(viridis))
bm <- 1
par(las=1,bty="n"); xlim <- c(-5,5); ylim <- c(0,0.5)
set.seed(12)
N <- 2000
rr <- rnorm(N); rr2 <- rnorm(N^2); rr3 <- rnorm(N+0.3)</pre>
rrd <- density(rr);rrd2 <- density(rr2);rrd3 <- density(rr3)</pre>
main <- pasteO(N," points but plot better");xlab <- "Points in space"</pre>
if(bm==1){
 layout(matrix(c(rep(1,3),2:4), 2, 3, byrow = TRUE));sc <- 1
 plot(rr,las=1,bty="n",col=adjustcolor(viridis(N),0.5),pch=20,cex=runif(10,1,5),
       main=main,xlab=xlab)
for(r in list(rrd,rrd2,rrd3)){
  plot(r,xlim=xlim,ylim=ylim,main="")
 polygon(r,col=adjustcolor(viridis(250)[sc],0.5),border=viridis(250)[sc]);sc <- sc+100}</pre>
}else{par(mfrow=c(1,1))
 plot(rr,las=1,bty="n",col=adjustcolor(viridis(N),0.5),pch=20,cex=runif(10,1,5),
       main=main,xlab=xlab)}
```

#### 2000 points but plot better

N = 2000 Bandwidth = 0. = 4000000 Bandwidth = 0 N = 2000 Bandwidth = 0.

Figure 2. Example of a plot with improved graphics and its associated code embedded into the output document from RMarkdown.

## And tables

Table 1. Definitions of model parameters for individual hosts and **parasites**. Dimensions and units: -, dimensionless; cm, centimetres; J, Joules; L, length.

Parameter	Definition	Dimension(unit)
L	structural length	cm
ee	scaled reserve density	$J (cm^3)$
D	host development	_
RH	energy in reproduction buffer	J

## Use buttons or tabs for sub-chapters

#### Chapter 1

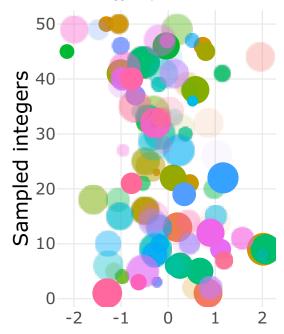

. . . . .

Then you can add whatever you want here like you would normally write in the  ${\tt Rmd}$  file.

. . . . .

#### Chapter 2 (with new code)

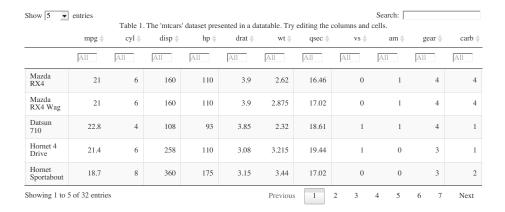

Here's an Easter egg for you  $\dots$ 

## andom normally distributed

#### More tables

Here's a new way of creating tables using the DT package

#### Embed code from different languages

This is R code

```
pck <- 0
if(pck==1){
    p<-c("rJava", "RNetLogo"); remove.packages(p)
    # then install rJava and RNetLogo from source
    install.packages("rJava", repos = "https://cran.r-project.org/")
    install.packages("RNetLogo", repos = "https://cran.r-project.org/")
}</pre>
```

#### shell/bash

```
echo "Hello Bash!"

pwd # check working dir
git init # initialise git
```

#### Octave (and MATLAB from the RMatlab package).

RMatlab documentation.

#### HTML

```
<!-- links-->
       <div class="footer">
           <a href="dd_feed.html"
           class="transition fade_in">
               Latest post
           </a>
                
           <a href="dd_contact.html"</pre>
           class="transition fade_in">
              Contact
           </a>
                
           <a href="dd_subscribe.html"</pre>
           class="transition fade_in">
               Subscribe
           </a>
       </div>
```

#### CSS

```
# custom code for the tabs in this file
.btn {
    border-width: 0 0px 0px 0px;
    font-weight: normal;
    text-transform: ;
}
.btn-default {
    color: #f08080;
    background-color: #ffffff;
    border-color: #ffffff;
}
```

Javascript to access html and css

```
$('.title').css('color', 'red')
```

#### Python

```
x = 'hello, python world!'
print(x.split(' '))
```

#### Here's a complete list of available languages

```
names(knitr::knit_engines$get())
